

A

Distinct underground–organ contexts

morphologically non–equivalent structures

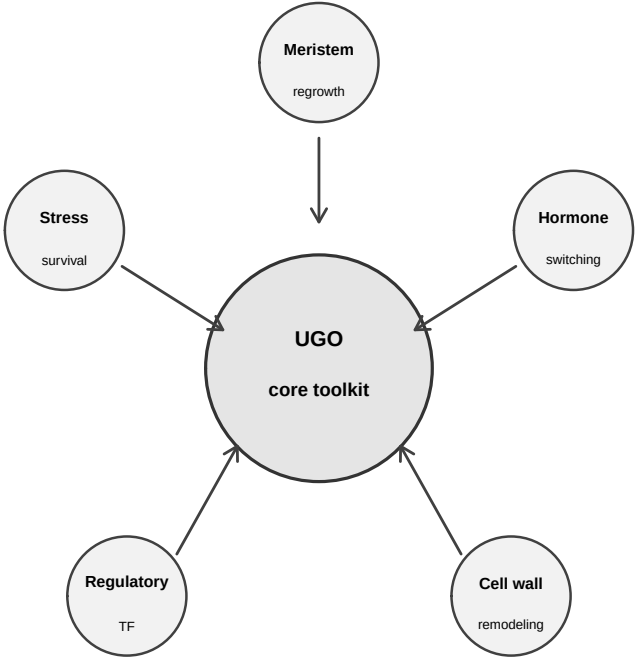

Interpretation: these organs should not be treated as a single homologous structure.

B

Conserved regeneration–resilience toolkit

candidate modules recurring across the backbone

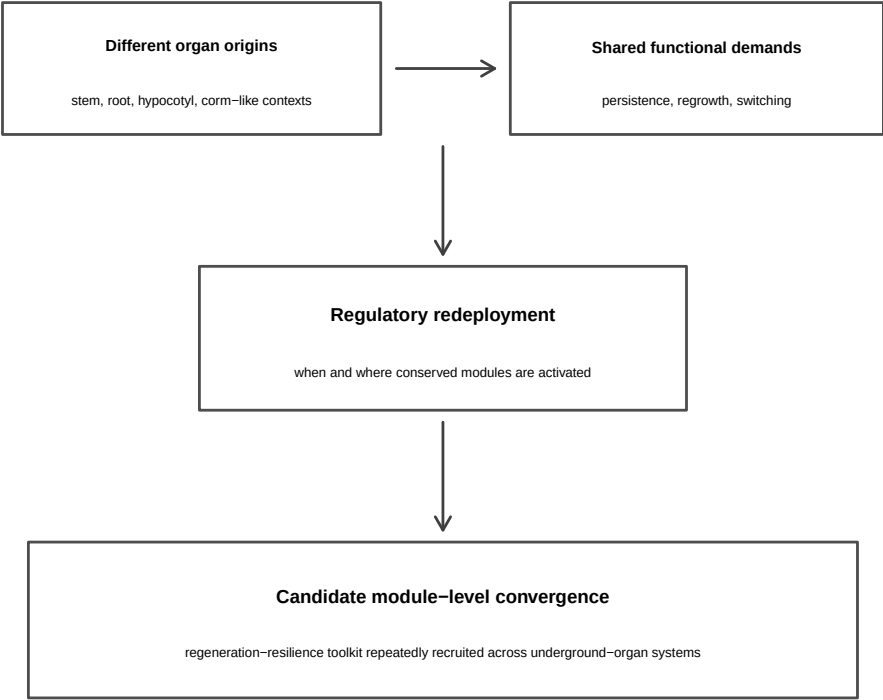

Core idea: repeated recruitment of conserved functional modules, not strict organ–level homology.

C

Recurrent modular reactivation model

module–level convergence and regulatory redeployment

Claim calibration: a testable evolutionary model, not definitive origin reconstruction or functional validation.
