

A UGO–Omics user entry points

designed for sequence, gene–list, species, and organ questions

Goal: convert common researcher inputs into comparable underground–organ candidate context.

B Sequence and gene–list workflows

from user input to candidate module interpretation

C Resource discovery workflows

start from species, resource, or underground–organ category

D Why the workflows matter

UGO–Omics is a reusable discovery platform, not only a data viewer

Claim calibration: workflows prioritize candidates and modules; they do not validate individual gene function.
